HymenopteraMine is an integrative resource for genomic data on Hymenoptera, including honeybees, ants, wasps, etc. Powered by [InterMine](#), it provides a user-friendly way to access genomic, proteomic, interaction and literature data. HymenopteraMine is a part of the [Hymenoptera Genome Database](#).

This tutorial is aimed at giving users an introduction to the different parts of HymenopteraMine and how users can make the most of HymenopteraMine.

Main site: <http://hymenopteragenome.org/hymenopteramine>

HGD YouTube Channel with HymenopteraMine Videos: <https://www.youtube.com/channel/UC1NVFd9buEtlbA2mcdq0MXQ>

List of available datasets in HymenopteraMine: <http://hymenopteragenome.org/hymenopteramine/dataCategories.do>

Overview of HymenopteraMine

Below is a brief summary of the layout of HymenopteraMine:

Home – The home page for HymenopteraMine.

Templates – List of templates that users may select from based on the nature of their query.

Lists – Allows users to upload lists of genes and perform enrichment analyses. Logged-in users may save their lists for future use.

QueryBuilder – Allows users to build custom queries by browsing the HymenopteraMine data model and customize their results. The queries may be exported to a number of formats including XML.

Regions – Genomic Region Search page where users may enter genomic coordinates and fetch features that fall within the interval. The interval may be extended to increase the range of search.

Data sources – Table of all data sources with their links, date of download, and related publication(s).

Help – Links to the HymenopteraMine tutorial.

API – Describes the InterMine API that allows users to programmatically access HymenopteraMine.

HGD Blast – Links to a Blast page where users may BLAST their sequence(s) of interest with the Hymenoptera species reference genome, CDS sequences, and protein sequences.

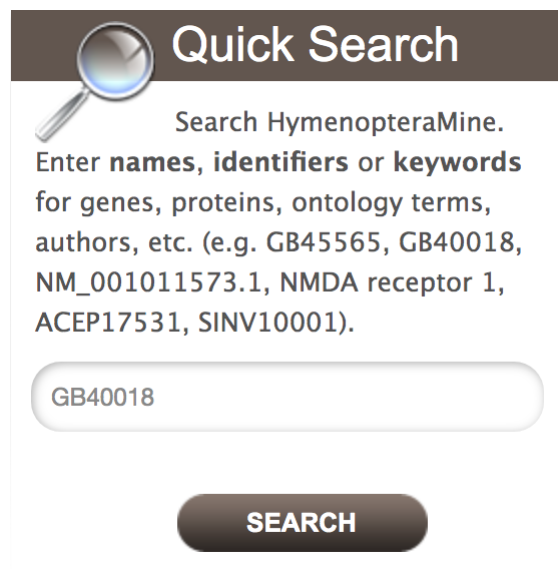

MyMine – Once users are logged in, MyMine serves as portal for accessing saved lists and saved templates. Users may also check their account details and manage their account using MyMine.

Searching in HymenopteraMine

There are several ways that users may query HymenopteraMine.

2.1 Quick Search

The **Quick Search** enables users to search keywords from any of the datasets on HymenopteraMine. The quick search box is located on the main page and in the upper-right corner of each page.

The image shows a 'Quick Search' interface. At the top, there is a dark brown header bar with a magnifying glass icon on the left and the text 'Quick Search' in white. Below the header, the text 'Search HymenopteraMine.' is displayed. This is followed by instructions: 'Enter names, identifiers or keywords for genes, proteins, ontology terms, authors, etc. (e.g. GB45565, GB40018, NM_001011573.1, NMDA receptor 1, ACEP17531, SINV10001).' Below the text is a light gray rounded rectangular input field containing the text 'GB40018'. At the bottom of the search box is a dark brown rounded rectangular button with the word 'SEARCH' in white capital letters.

Quick Search

Search HymenopteraMine.

Enter **names, identifiers or keywords** for genes, proteins, ontology terms, authors, etc. (e.g. GB45565, GB40018, NM_001011573.1, NMDA receptor 1, ACEP17531, SINV10001).

GB40018

SEARCH

Fig. 1: Quick Search from home page

Users may enter gene names, gene identifiers, or keywords to search for within HymenopteraMine. The wildcard character * may be used to get all results matching the search query.

Fig. 2: Quick Search from any page

As an example, to search on the gene **LCCH3**, enter **LCCH3** into the quick search box and click **Search**. The results page displays a summary for the query in a tabular format.

Search our database by keyword

LCCH3 Search

Examples

- Search this entire website. Enter **identifiers, names or keywords** for genes, pathways, authors, ontology terms, etc. (e.g. *eve*, *embryo*, *zen*, *allele*)
- Use **OR** to search for either of two terms (e.g. *fly OR drosophila*) or quotation marks to search for phrases (e.g. *"dna binding"*).
- Boolean search syntax** is supported: e.g. *dros** for partial matches or *fly AND NOT embryo* to exclude a term

Search results 1 to 21 out of 21 for *LCCH3*

Fig. 3: Example: Search results for LCCH3

The search results may be filtered by **Category** or **Organism**. The score column in the result table indicates the similarity of the query to the result fetched by HymenopteraMine.

The results page may also be converted to a list. To enable this feature, click on **Gene** in **Hits by Category**. Select the gene(s) to be included in the list, and click on the **Create List** button just above the table of search results. Lists are described in more detail in the [Lists](#) section.

2.2 Templates

Another method of searching HymenopteraMine is through the use of **templates** (predefined queries). Popular templates are displayed on the home page, grouped by category (Genes, Protein, Homology, etc.) The full list of templates may be viewed by clicking the **Templates** menu tab.

As an example, the **GO Term Gene** template queries HymenopteraMine for all genes annotated with a given GO term.

The results page shows all the genes having the Gene Ontology term “DNA Binding” in their annotation. When logged

GENES	PROTEIN	HOMOLOGY	FUNCTION	ENTIRE GENE SET	ALIAS AND DBXREF
-------	---------	----------	----------	-----------------	------------------

Gene models in HymenopteraMine come from multiple sources including NCBI RefSeq and consortium official gene sets. RefSeq data sources are labeled with 4-letter species code and "_RefSeq" in pull down menus. Consortium data sources are labeled using the original consortium official gene set names, and may have "HGD" appended, if the data source has ids assigned by HGD. Use "ALIAS AND DBXREF" templates to convert identifiers.

Query for genes:

- Gene ➡ Transcript + Exon
- Gene ID ➡ Coding Sequences
- Gene ID ➡ Gene Symbol and Description
- Gene ➡ Chromosomal location
- Gene Symbol ➡ Gene ID
- Organism and Chromosome ➡ Genes
- Gene ID ➡ Transcript id(s)
- RefSeq Gene Set ➡ Symbols and Descriptions

popular templates

Fig. 5: Popular templates

Please contact us if you would like any additional template queries or if you have a concern about a query not completing.

Templates

Templates are predefined queries, each has a simple form and a description. Click on a template to run it, you can search for templates by keyword and filter them by category.

Filter: Filter: -- all categories -- Reset

Actions: Export selected Options: ☒ Show descriptions ☐ Show Tags

You are not logged in. [Log in](#) to mark items as favourites .

☐ **Gene ID --> GO Terms**
Given a gene id, retrieve GO terms.

☐ **Organism --> All Gene IDs --> Gene Alias IDs**
Retrieve gene ids and their aliases for an organism. Multiple gene sets may be returned if the gene source is not selected. See the Data Source page for gene source names. This template can be used for *A. dorsata*, *A. florea*, *A. mellifera*, *B. impatiens*, *B. terrestris*, *L. humile*, *P. barbatus*, *W. auropunctata*.

☐ **Gene ID --> Homologues**
Given a gene id, retrieve all homologues.

☐ **Organism --> Homologues**
Retrieve homologues for an organism.

☐ **Alias ID --> Gene ID**
Given an Alias ID, retrieve Gene ID, optionally constrained by gene source. This template can be used for *A. dorsata*, *A. florea*, *A. mellifera*, *B. impatiens*, *B. terrestris*, *L. humile*, *P. barbatus*, *W. auropunctata*.

☐ **Gene Symbol --> GO Terms**
Given a Gene Symbol, retrieve GO terms.

☐ **Gene ID --> Pathways**
Given a gene id, retrieve pathways.

Fig. 6: List of templates on the Templates page

GO Term → Gene

Given a GO term, retrieve genes annotated with that GO Term for all organisms, or an optionally selected organism.

Fig. 8: Example: Results after searching on *GO:0003677* (identifier for GO term “DNA binding”)

2.2.1 Generate query code

The code for each query may be obtained by clicking on the arrow next to **Generate Python Code** and choosing the desired language from the pull-down menu. The language options are Python, Perl, Java, Ruby, JavaScript, and XML.

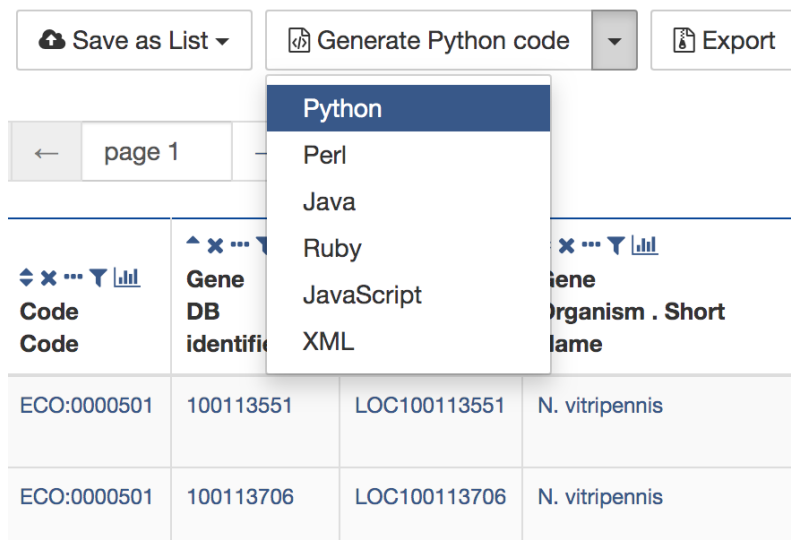

Fig. 9: Generate code options

2.2.2 Download results

The search results may also be downloaded by clicking the **Export** button above the table and choosing the desired format from the pull-down menu to the right of the File name field (blue box in the figure below). Available formats are tab-separated values, comma-separated values, XML, and JSON. When the results contain genomic features, they may also be downloaded in FASTA, GFF3, or BED format. Other options may be specified in the submenu to the left of the download box (orange box in the figure below). By default, all rows and all columns are downloaded, but individual columns may be included or excluded by clicking on the toggles next to the column headers in the **All Columns** submenu. The number of rows and row offset are set in the **All Rows** submenu. Download the results as a compressed file by choosing GZIP or ZIP format in the **Compression** submenu (default is **No Compression**). Column headers are not added by default but may be included under the **Column Headers** submenu. Finally, the **Preview** submenu displays the first three rows of the file to be downloaded so that the desired format and options may be finalized before beginning the download. When ready, click the **Download file** button to download the results.

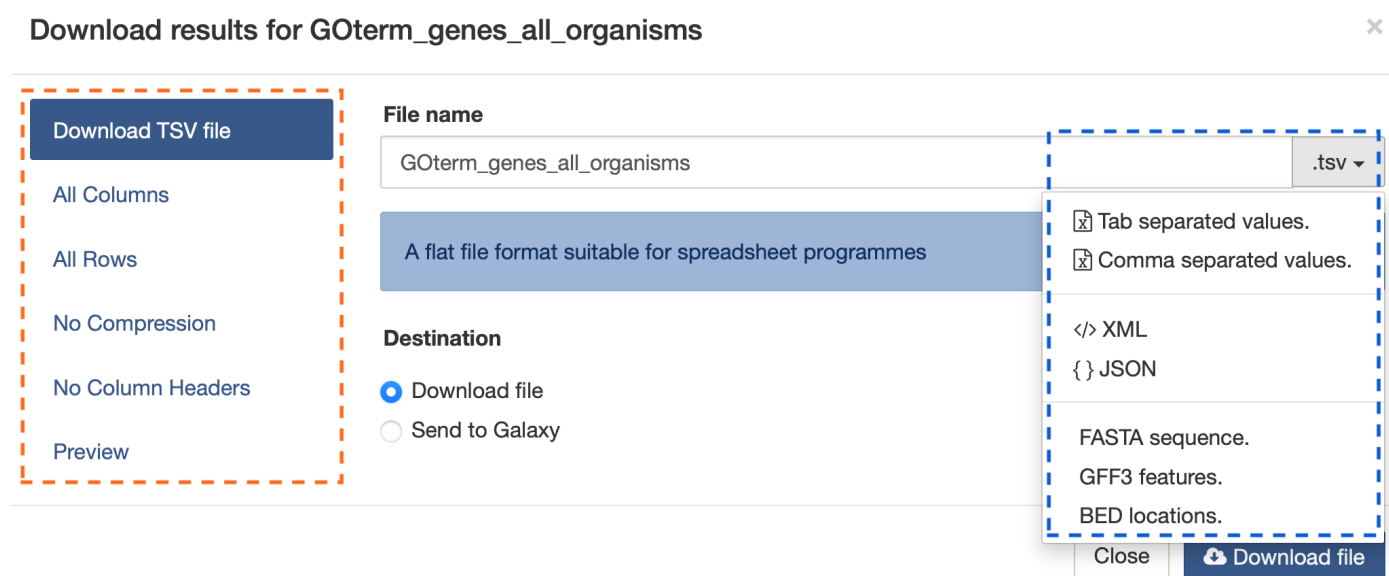

Fig. 10: Download results options

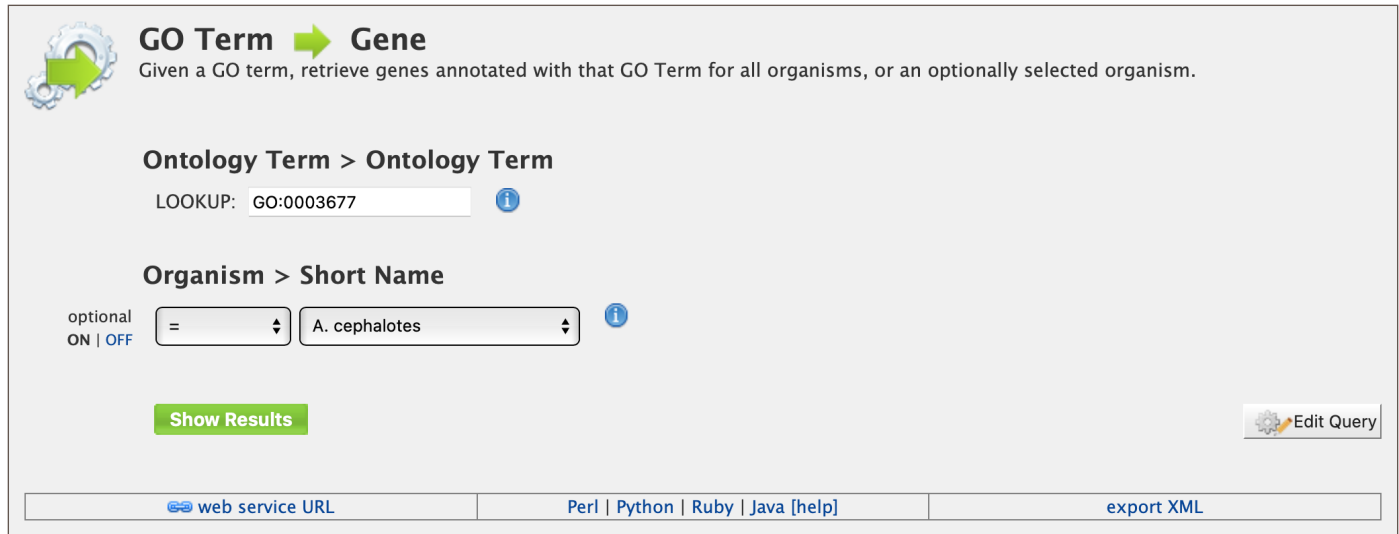

2.2.3 Customize output

Click the **Manage Columns** button to customize the results table layout. Edit or remove active filters by clicking the **Manage Filters** button. Click **Manage Relationships** to specify the entity relationships within the query.

2.2.4 Optional filters

Some templates have optional filters that are disabled by default. For example, the GO Term Gene template has an additional filter for specifying an organism. To enable this filter, click **ON** below **optional**.

Note: The Query trail link at the top of the page does not work for templates with optional filters. To edit the template query, navigate back to the template page either by clicking on the template name at the top of the query results page or by selecting the template from the Templates tab.

GO Term → **Gene**
Given a GO term, retrieve genes annotated with that GO Term for all organisms, or an optionally selected organism.

2.3 QueryBuilder

While the templates provided are suitable for many different types of searches, new queries may be built from scratch using the **QueryBuilder**. The possibilities of queries using the QueryBuilder are endless. The output may be formatted exactly as desired, and the query constraints may be chosen to perform complex search operations.

QueryBuilder
Advanced users can use a flexible query interface to construct their own data mining queries. The QueryBuilder lets you view the data model, apply constraints and select output. You can also export queries to share them with others.

Coding Sequence

[Select](#)

To begin, select a **Data Type**. For example, select **Gene** as a Data Type and click the **Select** button.

2.3.1 Model browser

After choosing a data type, the **Model browser** appears displaying the attributes for the selected feature class.

Using the model browser, fields and constraints may be added to the query. Clicking **Show** to the right of an attribute will add that field to the query. Clicking **Constrain** brings up a window with filter options for the attribute selected. The **Query Overview** summarizes the current state of the query; it displays the currently selected fields and constraint logic. The results columns are displayed at the bottom of the page, where they may be rearranged or removed.

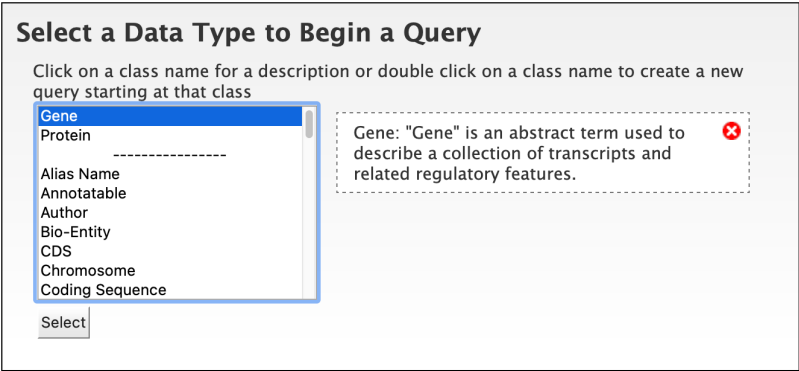

Fig. 12: Example: Gene data type selected in QueryBuilder

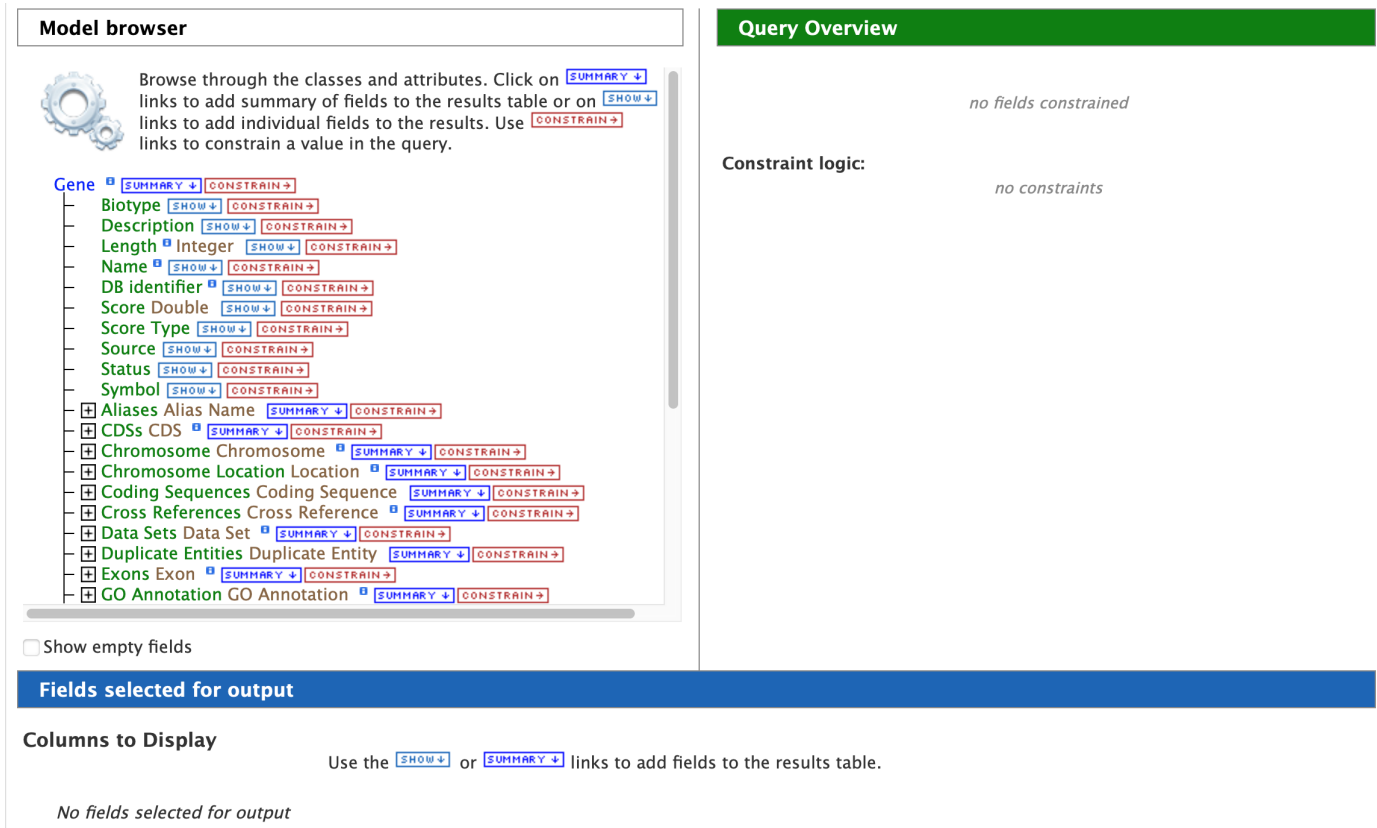

Fig. 13: Model browser with Gene selected as data type

2.3.2 Examples

The following examples give a more in-depth demonstration on how to use the QueryBuilder. All examples use Gene as the selected data type.

2.3.2.1 Example 1: Querying for protein coding genes

In the Model browser, click **Show** next to **DB Identifier** and **Symbol**, which will add these fields to the query. Notice that these two fields appear below Gene in the **Query Overview** section and at the bottom under **Fields selected for output**.

The screenshot displays the QueryBuilder interface with three main sections:

- Model browser:** A tree view of the database schema. The 'Gene' class is expanded, showing attributes like Biotype, Description, Length, Name, DB identifier, Score, Score Type, Source, Status, and Symbol. Each attribute has 'SUMMARY', 'SHOW', and 'CONSTRAIN' links. A 'Show empty fields' checkbox is at the bottom.
- Query Overview:** A green header section showing the selected data type 'Gene' and the added fields 'DB identifier' and 'Symbol', each with a red 'X' icon. Below it, the 'Constraint logic' section shows 'no constraints'.
- Fields selected for output:** A blue header section with the title 'Columns to Display'. It includes instructions on using 'SHOW' or 'SUMMARY' links and a 'REMOVE ALL' button. Below the instructions, two output boxes are shown: 'Gene > DB identifier (no description)' and 'Gene > Symbol (no description)', each with a red 'X' icon and a blue pencil icon.

Fig. 14: Step 1: Select fields to be added to the query

Then click **Constrain** next to **Biotype**. The first drop-down menu defaults to = (equals sign). In the second drop-down menu, select **Protein Coding**, then click the **Add to query** button. This adds a constraint to the query to search only for protein coding genes. Notice that the Query Overview section now shows “Biotype = Protein Coding”. Also, two types of icons appear next to the attributes. Clicking on the red “X” icon next to an attribute will remove that field or constraint from the query. Clicking on the blue pencil icon next to a constraint brings up the constraint editing window from earlier where changes may be made to the query filters.

Finally, click on the **Show results** button above the Model browser. The resulting table contains all protein coding genes in the database, with DB Identifier and Gene Symbol as the two table columns.

Model browser

Browse through the classes and attributes. Click on [SUMMARY](#) links to add summary of fields to the results table or on [SHOW](#) links to add individual fields to the results. Use [CONSTRAIN](#) links to constrain a value in the query.

Fig. 16: Step 3: Display query results

2.3.2.2 Example 2: Querying for protein coding genes on a particular chromosome

This example will extend the first example to add another constraint to the query.

After running the query in the above example, click on **Query** at the top of the page next to **Trail** to go back to the model browser and edit the query.

Fig. 17: Click on the query trail to edit the query

In the Model browser, click the + (plus sign) next to the Chromosome feature class to display its attributes.

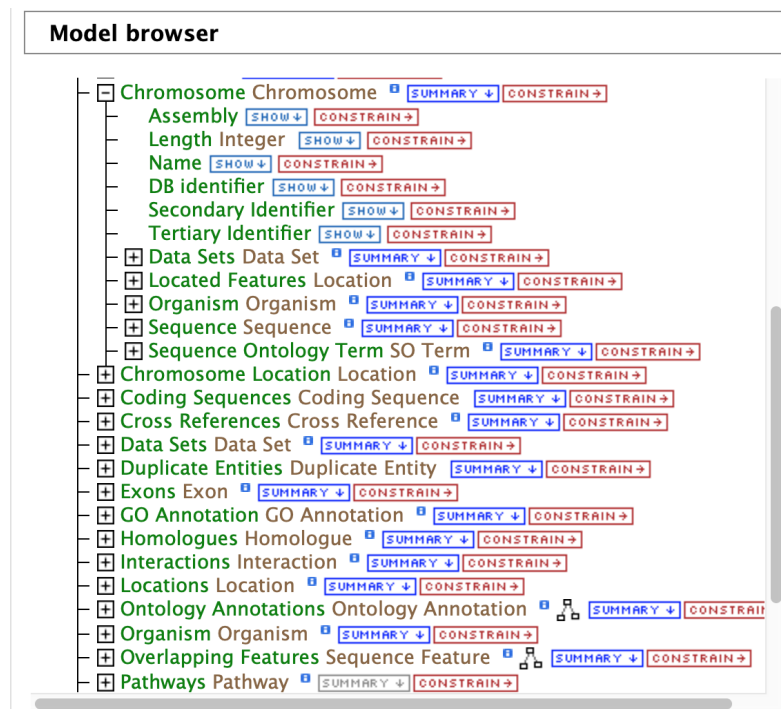

Fig. 18: Step 1: View attributes of the Chromosome feature class

Then click **Constrain** next to the attribute **DB Identifier**. In the pop-up window, enter **NW_003791143.1** into the text field, and click **Add to query**. This adds an additional constraint to the query that searches for protein coding genes on a chromosome with the DB identifier *NW_003791143.1*.

Click the **Show results** button as before to view the results of the query. The columns are the same as in the first example, but notice that now there are only 625 rows in the table (compared to over 500,000 in the first query) due to the additional constraint.

2.3.2.3 Example 3: Querying for protein coding genes on a particular chromosome and their exons

This final example extends the above query to display all exons for each protein coding gene.

As above, click on **Query** at the top of the results page to go back to the model browser and edit the query.

Model browser

Browse through the classes and attributes. Click on [SUMMARY](#) links to add summary of fields to the results table or on [SHOW](#) links to add individual fields to the results. Use [CONSTRAIN](#) links to constrain a value in the query.

Chapter 2. Searching in HymenopteraMine

In the Model browser, scroll down to locate the **Exon** feature class, and click the + (plus sign) next to Exons to display its attributes. Click **Show** next to **DB Identifier** and **Length**.

The screenshot shows the 'Model browser' on the left with a tree of biological features. 'Exons Exon' is selected, and its attributes 'DB identifier' and 'Length' are added to the 'Query Overview' on the right. The 'Query Overview' shows a query structure: Gene (Biotype = Protein Coding (A)) joined with Exons Exon collection (DB identifier = NW_003791143.1 (B)). The 'Constraint logic' section shows 'A and B'.

Fig. 21: Step 1: Select Exon fields to be added to the query

The **Query Overview** shows the query in progress, with four fields and two constraints. Also notice that a third type of icon, a blue square, appears next to a couple of the attributes. Clicking on a blue square icon next to an attribute brings up a window where the query **Join Style** may be modified. Click on the blue square icon next to **Exon collection** to bring up the Switch Join Style window. The default option is **Show only Genes if they have a Exon**. Change this to **Show all Genes and show Exons if they are present** and click **Add to query**.

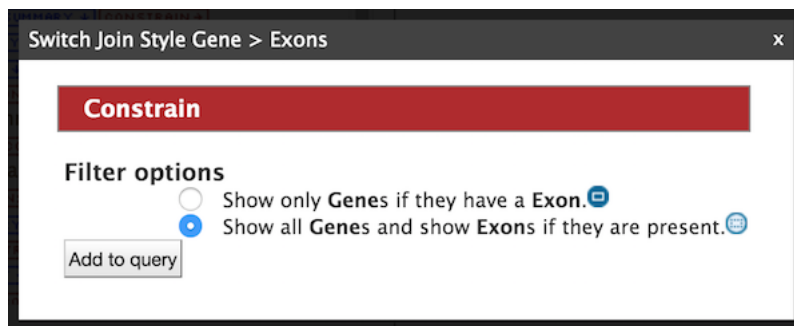

Fig. 22: Step 2: Change the join style

Click **Show results** to run the query.

Notice that the results table contains the same rows as in the second example, but now there is a new column, **Gene Exons**. For example, looking at the second row, the Gene with DB Identifier 100862997 has 12 exons. Click on the **12 exons** text to expand the table with additional rows containing the DB identifier and Length for each of the 12 exons.

By changing the join style, the exons have been grouped together by gene, making it easier to see how many exons each gene has. By contrast, if the query is run with the default option of “Show only Genes if they have a Exon”, the results table adds a new row for each exon.

2.4 Genomic Regions Search

The **Genomic Regions Search** is a tool to fetch features that are within a given set of genomic coordinates or are within a given number of bases flanking the coordinates.

To begin this type of search, click the **Regions** tab on the menu. A form will appear asking for the search parameters (organism, feature types, genomic coordinates, etc.)

The coordinates must have one of three formats:

1. chromosome_name:start..end
2. chromosome_name:start-end
3. chromosome_name start end (tab delimited)

Click on the input examples to view a representative set of coordinates in each format. Click the **Genome coordinates help** text near the top of the form for more detailed information on the input format requirements.

The regions may be extended on either side of the genomic coordinates using the slider or the text field next to it. There is also the option to perform a strand-specific region search using the checkbox at the bottom of the form.

As an example, select **A. mellifera** from the **Select Organism** drop-down, check the box next to **Gene** in the **Select Feature Types** section, and enter the following coordinates into the genomic regions search text field:

LG5:900000..930000

Then click **Search**. The search results page presents a list of features present within the genomic interval that was entered. In this case, the feature type was limited to Gene. The results may be exported as tab-separated or comma-separated values. If they contain genomic features, there is also the option to save the results in GFF3 or BED format. The FASTA sequences of the features may also be downloaded.

CHAPTER 3

Report Pages

Every object (e.g., Gene, Protein, Exon) in HymenopteraMine has a report page. The layout of the report page depends on the data available for the object. Report pages may be accessed by clicking on an object name in the results table after running a query.

As an example, on the home page of HymenopteraMine, click on the **Protein** tab in the **Popular Templates** section. (Refer to the [Templates](#) section for more details on using templates to search the database.) Click on the **Gene Symbol** → **Proteins** template. In the text field, enter **LCCH3**, and select **A. mellifera** as the Organism. Then click **Show Results**.

Notice that each item in the results table is a hyperlink. Hover over an item to bring up a quick summary window for that item. For example, hover over **LCCH3** to view a summary of the gene with this symbol. The summary contains the gene's biotype, database identifier, description, length, organism, symbol, and source. Similarly, hover over **Q0GQR5_APIME** to view a summary of the protein with this DB Identifier.

Clicking on an item in the table rather than just hovering over it will bring up its report page. For example, click on **LCCH3** in the Gene Symbol column to view its report.

The report page provides a complete description for this gene. The header displays the database identifier, followed by the information from the summary window for the gene (organism, symbol, source, etc.) **Biotype** indicates the type of gene; in this case the type is protein coding.

The contents of the report page are divided into categories based on the type of information provided.

3.1 Summary

A **Summary** section near the top of the report provides information on the gene such as its length, chromosome location, and strand information.

3.2 Alias and DBxref

The **Alias and DBxref** section displays a table of aliases and database cross references for the gene. In this example, the gene with DB Identifier 412740 has four aliases and two cross references. Click on the text **4 Alias Names** and **2 Cross References** to expand the table with additional rows containing the ID and Source for each alias and DB Identifier and Source for each cross reference.

3.5 Function

The **Function** section displays Gene Ontology annotations for a gene. Annotations are divided into three categories:

- Cellular Component
- Molecular function
- Biological process

The GO terms are displayed along with the evidence code indicating how the annotations were derived. If applicable, a table of information on Pathways is also shown.

Function

3.8 Other

This last section provides miscellaneous information that doesn't fit into any of the above categories, e.g., data sets including a gene, protein domain regions for a protein, etc.

4.1 Creating Lists

Users may create and save lists of features, such as gene IDs, transcript IDs, gene symbols, etc. The list tool searches the database for the list items and attempts to convert each identifier to the selected type. Click on the **Lists** tab from the menu to access the full list upload form. A short version of the form is also in the **Quick List** box on the home page.

As an example, enter the following identifiers (comma-separated):

GB41586, Sec61Beta, TRAM, Mocsl, mal

Leave the **Select Type** as “Gene” and **Organism** drop-down as “Any”. Then click **Create List**. A Summary table is displayed with the results of searching for each of the five identifiers in the list.

Next, click **Save a list of 5 Genes**. A **List Analysis** page is presented that contains widgets allowing users to perform analyses on the genes in the list.

The available widgets are:

1. Chromosome Distribution
2. Gene Ontology Enrichment
3. Protein Domain Enrichment
4. Publication Enrichment
5. Pathway Enrichment
6. Orthologues

The selection of widgets provided on the List Analysis page depend on the contents of the list. In the above example, three widgets appear: Gene Ontology Enrichment, Publication Enrichment, and Pathway Enrichment.

Read the **Important Notes for Enrichment Widgets** for special instructions to avoid false positives.

Upload

View

Search:

1 Upload list of identifiers

2 Verify identifier matches

List analysis

List

• genes

• proteins

• other

Create a new list

Select the type of list to create and either enter in a list of identifiers or upload identifiers from a file. A search will be performed for all the identifiers in your list.

• Separate identifiers by a **comma**, **space**, **tab** or **new line**.

• Qualify any identifiers that contain whitespace with double quotes like so: "even skipped".

Select Type:

for Organism:

Type/Paste in identifiers

Fig. 3: Example: List analysis for gene list

Important Notes for Enrichment Widgets to avoid false positives:

1. If your gene list contains genes from more than one gene set (e.g. AGPv3.21, AGPv4 and/or RefSeq), it is critical that you create new lists for each specific gene set and then redo the analyses separately by clicking the newly saved lists on your List View page. above for a particular gene set using the histogram icon above the Gene Source column in the table above. Then "Save as List".
2. You should change the background population from the default to one of the available gene sets or your own background gene list.

Gene Ontology Enrichment

GO terms enriched for items in this list.

All items in your list have been analysed.

Test Correction: Holm-Bonferroni | Max p-value: 0.05 | Ontology: biological_process

Background population: Default | Change

View | Download

GO Term	p-Value	Matches
<input type="checkbox"/> cotranslational protein targeting to membrane [GO:0006613]	3.981197e-4	3
<input type="checkbox"/> SRP-dependent cotranslational protein targeting to membrane [GO:0006614]	3.981197e-4	3
<input type="checkbox"/> protein targeting to ER [GO:0045047]	0.001342	3

4.2 Saving Lists

Saved lists appear under the **View** tab on the Lists page. For users who are not logged in, lists are saved temporarily; users must log in to save lists permanently. Saved lists may also be accessed from the **MyMine** menu item.

Predefined lists of all genes from different species are also available on the Lists page for all users.

Upload | **View** Search: **GO**

Lists

View your own and public lists, search by keyword and compare or combine the contents of lists. Click on a list to view graphs and summaries in an analysis page, select lists using checkboxes to perform set operations. Click 'Upload' above to import a new list.

CHAPTER 5

MyMine

MyMine serves as a portal where logged-in users may manage their lists, queries, templates, and account details.

To access MyMine, click on the **MyMine** menu tab. A submenu appears with six options:

Lists - Saved lists.

History - List of queries recently run.

Queries - List of saved queries.

Templates - Templates created or marked as “Favorite”.

Password - Password reset form.

Account Details - User preferences form.

 **Lists** | **History** |  **Queries** |  **Templates** | **Password** | **Account Details**

CHAPTER 6

API

An API is available for users who would like to programmatically access HymenopteraMine.

[Perl](#) | [Python](#) | [Ruby](#) | [Java](#)

Search:

Perl Web Service Client

The Perl web service client library makes it easy to run queries in HymenopteraMine directly from Perl programs. You can use these modules to construct any query you could run from web interface and fetch the results in a number of formats, including native Perl data structures and objects, and TSV/CSV strings.

Like all our code, it is open-source, coming licensed under the LGPL. For information on our API, visit our [wiki pages](#).

- Prerequisites**

You should install the [Perl webservice client library module](#) to get started. You can install it directly from CPAN (the comprehensive Perl archive network). This is a public repository of thousands of modules. Using CPAN will ensure you get the latest version, and that your dependencies are automatically managed for you.

To install the InterMine Perl client library type the following command into a shell:

```
> sudo cpan Webservice::InterMine
```
- Examples of using the downloaded script**

On each Template Query page and the QueryBuilder there is a link to get Perl code to run that particular query using the web service API. Just click the link, save the generated Perl script in a file and execute it. You can use the generated code as a starting point for your own programs. You can run the downloaded script by running the following command in a shell:

```
> perl path/to/downloaded/script.pl
```

If you get an error saying `Cannot find Webservice::InterMine in @INC`, or similar then see 'Prerequisites' above.

Feel free to edit the script – these are designed to be spring-boards to help you get where you want to. See the [Cookbook](#), which contains a set of short tutorial 'recipes' that demonstrate particular features of the Perl API, for ways to edit the scripts, and even extend their functionality. For a good reference to writing programs in Perl, see [here](#).

Perl, Python, Ruby, and Java are the languages supported by the InterMine API.

For more detailed information, view the [InterMine documentation](#).

CHAPTER 7

Data Sources

The Data Sources table provides a description of the datasets that are integrated into HymenopteraMine, along with their date of download, version or release, citations wherever applicable, and any additional comments.
